The most common computing times for algorithms we will see here are $O(1) < O(\log n) < O(n) < O(n \log n) < O(n^2) < O(n^3) < O(2^n)$ Analyzing al-orithms 29 $O(1)$ means that the number of executions of basic operations is fixed and hence the total time is bounded by a constant.

Accordingly, algorithms designed to be executed on such machines are called sequential algorithms. The central assumption of the RAM model does not hold for some newer computers that can execute operations concurrently, i.e., in parallel. Algorithms that take advantage of this capability are called parallel algorithms. Still, studying the classic techniques for design and analysis of algorithms under the RAM model remains the cornerstone of algorithmics for the foreseeable future.
