Instructions. Using the pull-down menus, select values for a, b, c, and d. The graph of the function will be updated automatically. Selecting the "show base function" option causes the basic function (with $a = b = 1$ and $c = d = 0$) to be graphed in red. The function with other values for the parameters appears in green.

Purplemath. You've already learned the basic trig graphs. But just as you could make the basic quadratic, $y = x^2$, more complicated, such as $y = -(x + 5)^2 - 3$, so also trig graphs can be made more complicated. We can transform and translate trig functions, just like you transformed and translated other functions in algebra. Let's start with the basic sine function, $f(t) = \sin(t)$.

Graphing Trigonometric Functions | Purplemath

There are six trigonometric functions as we know. The limit of each function tending to a point can be calculated according to the function's continuity considering its domain and range. We can observe this in the graph of every function that the limit of each function at the same point is different.

The trig functions can be defined using the measures of the sides of a right triangle. But they also have very useful definitions using the coordinates of points on a graph. First, let let the vertex of an angle be at the origin — the point (0,0) — and let the initial side of that angle lie along the positive x-axis and the terminal side be a rotation in a counterclockwise motion.
